

Avoid the

DANGER  **ZONE**

Stay Clear...Stay Alive

Electrical contact is a leading cause of injury and death in the U.S. construction industry.

Order your **free** kit to help your employees learn to avoid the **10-foot danger zone** around power lines... and stay alive.

nationalgrid

There is a minimum **10-foot danger zone** around overhead power lines. Many electrical contact injuries and deaths are the result of workers not taking proper precautions when working in or near the danger zone.

National Grid's free DANGERZONE Awareness kit provides the information your employees need to stay safe while working near overhead power lines. Presented in easy-to-understand terms, the kit includes:

- *Contractor Electrical Awareness* video – a 14-minute program providing the basics of electrical safety, accident prevention and what to do during an emergency involving contact with overhead power lines. It will help provide OSHA-required training for your employees.
- 25 copies of the brochure *Electrical Safety for Contractors and Homeowners*, which reinforces key messages in the video.
- DANGERZONE stickers to serve as constant safety reminders. Place on ladders, toolboxes, dashboards and other equipment.

And it's all [free!](#)
