

Better and brighter parking areas with LEDs

nationalgrid

HERE WITH YOU. HERE FOR YOU.

By replacing high-pressure sodium (HPS) fixtures (left) with LED lights (right), parking garages can improve color quality and light distribution while outputting fewer lumens. Plus, adding occupancy sensors and other lighting controls can save even more energy and money.

Compared to parking lots with HPS lamps (left), lots with LEDs (right) have even light distribution and superior visibility.

This gas station canopy installation photo showcases the directionality of LEDs. There's virtually no uplight or light trespass beyond the fueling area.

See your parking area in a new light. We have financial incentives for LEDs and controls. Call 1-800-787-1706, email energysavings@nationalgrid.com or visit ngrid.com/business.
